Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AS WELL AS SOME OTHER NEUROBCTODERMAL TUMORS, INCLUDING GLIOMAS.
-: SUBCELLULAR LOCATION: Secreted.
-: TISSUE SPECIFICITY: ALL MALIGNANT MELANOMA CELL LINES TESTED AND INFREQUENTLY IN GLIOMA CELL LINES.
-: PTM: MAY POSSESS TWO INTRAMOLECULAR DISULPIDE BONDS.
-: SIMILARITY: BELONGS TO THE MIA / OTOR FAMILY.
-: SIMILARITY: Contains 1 SH3 domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Bosserhoff A.-K., Hein R., Bogdahn U., Buettner R., structure and promoter analysis of the gene encoding the human melanoma-inhibiting protein MIA."; J. Mouse CD-RAP/MIA gene: structure, chromosomal localization, and

expression in cartilage and chondrosarcoma.";

expression in cartilage and chondrosarcoma.";

per Dyn. 208:516-525(1997).

ILL PUNCTION: ELICITS GROWTH INHIBITION ON MELANOWA CELLS IN VITRO AS

SIMILARITY: CATION: Secreted.

INTREQUENTLY IN GLIOWA CELL LINES TESTED AND

INTREQUENTLY IN GLIOWA CELL LINES.

INTREQUENTLY IN GLIOWA CELL LINES.

INTREQUENTLY SHOUNGS TO THE MIA / OTOR FAMILY.

C -- SIMILARITY: CONTAINS 1 SH3 domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    26 MPKLADWKLCADEECSHPISMAVALQDYVAPDCRFLTIYRGQVVYVFSKL---KGRGRLF 82

                                                                                                                              alphabet.
-!- SIMILARITY: Contains 1 calponin-homology (CH) domain.
-!- SIMILARITY: Contains 1 DBL-homology (DH) domain.
-!- SIMILARITY: Contains 1 DBL-homology (DH) domain.
-!- SIMILARITY: Contains 1 zinc-dependent phorbol-ester and DAG binding domain.
-!- SIMILARITY: Contains 1 SH2 domain.
-!- SIMILARITY: Contains 2 SH3 domains.
-!- CAUTION: Ref. 2 sequence differs from that shown due to frameshifts in position 322 and 355.
           FUNCTION: Couples tyrosine kinase signals with the activation of
the Rho/Rac GTPases, thus leading to cell differentiation and/or
proliferation.
                                                     -!- SUBUNIT: Interacts with SLA (By similarity). Interacts with Grb2
                                                                           -!- TISSUE SPECIFICITY: WIDELY EXPRESSED IN HEMATOPOIETIC CELLS BUT NOT IN OTHER CELL TYPES.
                                                                                                           -!- PTM: Phosphorylated on tyrosine residues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     MIM; 164875; -.

The amino acid sequence is predicted from a novel assembled cORA, see AAH26431 based on Hyage clone number 1637227. The protein has a mol.wt. of 14 kDa unglycosylated. GRLP belongs to the same protein family as growth regulatory proteins, growth factors, human melanoma derived growth regulatory protein growth factors, human melanoma derived growth regulatory protein. Or melanoma inhibitory activity, cattle cartilage-derived cretinoic acid sensitive protein (GD-RAP, 44% identity and 64% inflantity over 112 amino acids) or melanoma city over 126 amino acids) and other retinoic acid-sensitive proteins. GRLP polypeptides and polynucleotides of the invention can be used in the prophylaxis, treatment (including gene therapy) and diagnosis of disorders and disease caused by, or involving, cartilage development and maintenance, inhibition of melanoma cell growth and tumours, including neuroectodermal tumours such as growth and tumours, including neuroectodermal tumours such as also have mutritional uses, cytokine and cell proliferation or differentiation activity, stem cell growth factor activity, hammanosuppressive or immunosuppressive or immunosuppressive or immunosuppressive or immunosuppressive or immunosuppressive activity, demonstatic and therapy, drug screening, receptor/ligand activity, and therapy, drug screening, receptor/ligand activity, and therapy, activity, and treatment of leukaemia, nervous system disorders,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; angiogenesis; PRO protein; cardiovascularisation; wound; cancer; atherosclerosis; cardiac hypertrophy; gene therapy; endothelial disorder; cardiant; cytostatic; antiangiogenic; hypotensive; vulnerary; antiarteriosclerotic.
                                                                                                                                                                                                                                                                                                                                                                       The present invention describes novel MLP proteins and their encoding DNAs. The MLP proteins and DNAs have antiinflammatory and cardiant extivities, and can be used in gene therapy and as secretory cell function regulators. The MLP proteins and DNAs can be used in drugs, in the diagnosis and development of promoters and inhibitors for preventing to rreating bone and joint diseases as well as pathologic angiogenesis. AAF59063 to AAF59099 and AAB69122 to AAB69132 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              9
                                                                                                                                                                                                                                                                       Safe, low-toxicity secretory cell function-regulatory protein and encoded DNA, applicable as drugs, in diagnosis and development of promoters and inhibitors for preventing or treating e.g. bone and joint

PRO proteins. These are useful for treating or diagnosing a cardiavascular, endothelial or angiogenic disorder, including cardiac hypertrophy, trauma, cancer, age-related macular degeneration, atherosclerosis, hypertension, arterial restenosis, rheumatoid arthritis, angina, myocardial infarctions, thrombophiebitis, lymphangitis, tumour angiogenesis (such as breast carcinoma and liver carcinoma) and wound healing. The present sequence is a PRO protein of the invention.
                                                                                                                                                                                                                                                                                              KKGQQIYVYSKLVKENGAGEFWAGSVYGDGQDEMGVVGYFPRNLVKEQRVYQEATKEVPT 120

                                                                                                                                                                                                                                                                                                                                                 ABL88072 to ABL88258 encode the PRO proteins given in ABB84817 to ABL885003. The PRO proteins and polymucleotides have cardiant, cytostatic, antiangiogenic, hypotensive, vulnerary and antiarteriosclerotic activities, and can be used in gene therapy. The PRO polymucleotides, proteins, agonists and antagonists are useful for treating or diagnosing a cardiovascular, endothelial or angiogenic disorder in a mammal, e.g. cardiac hypertrophy, trauma, cancer, age-related macular theumatoid arthritis, angina, myceardial infarctions, thrombophhebitis, theumatoid arthritis, angina, myceardial infarctions, thrombophhebitis, lymphangitis, tumour angiogenesis (such as breast carcinoma and liver carcinoma) and wound healing. The PRO polymucleotides have applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping. ABL88259 to ABL88267 represent primers and probes used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             KKGQQIYVYSKLVKENGAGEFWAGSVYGDGQDEMGVVGYFPRNLVKEQRVYQEATKEVPT 120

One hundred and twenty two nucleic acids encoding PRO polypeptides, useful for treating a PRO related disorder and for diagnosing tumours such as lung cancer, colon cancer, breast tumour, prostate tumour, rectal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to one hundred and twenty two nucleic acids encode hundred acrose hundred and twenty two nucleic acids encode hunds secreted proteins. The PRO nucleic acids, polypeptides, agonists and antagonists are useful for treating a PRO related disorder. The PRO polypeptides are useful for diagnosing tumours, especially lung cancer, colon cancer, breast tumour, prostate tumour, rectal tumour or liver tumour. The PRO polypeptides are useful for stimulating the proliferation of, or gene expression, in periotte cells, for stimulating the proliferation or differentiation of chondrocyte cells, for stimulating the release of tumour necrosis factor-alpha from hunan blood, for stimulating or inhibiting the proliferation of normal human dermal fibroblast cells. The PRO polypeptide may also be used as molecular weight markers and for tissue typing. The PRO nucleic acids have
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     weight markers and for tissue typing. The PRO nucleic acids have applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping. AAU83592-AAU83713 represent human PRO protein sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Goddard A, Godowski PJ;

The invention relates to an isolated novel secreted polypeptide (I) and polynucleotide (II). (I) and (II) are useful for treating cancer, discorders, inclaimed diseases, wound healing disorder, infections, hematopoietic disorders, inclaimentory disorders, infertility, neurological and psychiatric diseases, cardiovascular diseases, respiratory diseases, renal diseases, or gastrointestinal diseases. These may also be used to treat diseases, abnormalities and disorders caused by abnormal expression, production, function and/or metabolism of the genes, as vaccines for inducing immunological response in a marmal, and in production of mRNA and polypeptide in cells. The polypeptides can be used as immunogens to produce antibodies immunospecific for the polypeptides,

The MLP proteins and DNAs have antiinflammatory and cardiant activities, and can be used in gene therapy and as secretory cell function regulators. The MLP proteins and DNAs can be used in drugs, in the diagnosis and development of promoters and inhibitors for preventing or treating bone and joint diseases as well as pathologic angiogenesis. The MLP proteins and DDAs have antinflammatory and cardiant activities, and can be used in gene therapy and as secretory cell function regulators. The MLP proteins and DDAs can be used in drugs, in the diagnosis and development of promoters and inhibitors for preventing or treating bone and joint diseases as well as pathologic angiogenesis. AAFS9063 to AAFS909 and AAB69122 to AAB69132 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Yoshimura K;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Safe, low-toxicity secretory cell function-regulatory protein and encoded DNA, applicable as drugs, in diagnosis and development of promoters and inhibitors for preventing or treating e.g. bone and joint

The MLP proteins and DNAs have antiinflammatory and cardiant estivities, and can be used in gene therapy and as secretory cell function regulators. The MLP proteins and DNAs can be used in drugs, in the diagnosis and development of promoters and inhibitors for preventing or treating bone and joint diseases as well as pathologic angiogenesis. Isolated human growth regulatory-like polypeptide useful for treating e.g. Alzheimer's disease, cancer, autoimmune disorders, hyperproliferative disorders, coagulation disorders, and nervous system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is that of a novel human growth regulatory-like polypeptide (GRLP) mature protein. The sequence is predicted from a novel assembled CDNA (see AAH26343) based on Hyseq clone number 16372272. The protein has a mol.wt. of 14 kDa unglycosylated. GRLP belongs to the same protein family as growth regulatory proteins, procurs, human melanoma derived growth regulatory proteins precursor (64% similarity and 45% identity over 11 amino acids)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             can be used in the prophlaxis, treatment (including gene therapy) and diagnosis of disorders and diseases caused by, or involving, artilage development and maintenance, inhibition of metanoma cell growth and tumours, including neuroectodermal tumours such as gliomas. The polypeptides, which include the GRLP mature protein, may also have nutritional uses, cytokine and cell proliferation activity, stem cell growth factor activity, haematopolesis regulating activity, tissue growth activity, immunosuppressive or immunostimulant activity, activininhibin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    or melanoma inhibitory activity, cattle cartilage-derived retinoic acid sensitive protein (CD-RAP, 44 identity and 64% similarity over 126 amino acids) and other retinoic acid-sensitive proteins. GRLP polypeptides and polynuclectides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                        Growth regulatory-like polypeptide; human; cartilage; melanoma; neuroectodermal tumour; glioma; cancer; therapy; diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, use in cancer diagnosis and therapy, drug screening, receptor/ligand activity, antiinflammatory activity, and treatment of leukaemia, nervous system disorders,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ford JE, Arterburn MC, Tang YT, Liu C;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes novel MLP proteins and their encoding DNAs. The MLP proteins and DNAs have antinflammatory and cardiant activities, and can be used in gene therapy and as secretory cell function regulators. The MLP proteins and DNAs can be used in drugs, in the diagnosis and development of promoters and inhibitors for preventing or treating bone and joint diseases as well as pathologic angiogenesis. AAFS9063 to AAFS9099 and AAB69122 to AAB69132 represent sequences used in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ÷
                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes novel MLP proteins and their encoding MAAS. The MLP proteins and DNAs have antinflammatory and cardiant activities, and can be used in gene therapy and as secretory cell function regulators. The MLP proteins and DNAs can be used in drugs, in the diagnosis and development of promoters and inhibitors for preventing to treating bone and joint diseases as well as pathologic angiogenesis. AAF55063 to AAF55099 and AAB69122 to AAB69132 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Safe, low-toxicity secretory cell function-regulatory protein and encoded DNA, applicable as drugs, in diagnosis and development of promoters and inhibitors for preventing or treating e.g. bone and joint diseases

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes novel MLP proteins and their encoding DNAs. The MLP proteins and DNAs have antiinflammatory and cardiant activities, and can be used in gene therapy and as secretory cell function regulators. The MLP proteins and DNAs can be used in drugs, in the diagnosis and development of promoters and inhibitors for preventing or treating bone and joint diseases as well as pathologic angiogenesis.                                                                                                                                                                                                                                                                   peripheral blood lymphocytes). Antibodies raised against the protein can be used to detect cell producing the protein and also for protein purification. Probes derived from DNA encoding the protein (AAQ84050, AAQ84051) can be used to detect sequences encoding the protein (AAQ84050, AAQ84051). The protein may be expressed as a fusion protein (conjugated with dihydrofolate reductase (DHFR)).

The invention relates to the use of melanoma inhibiting activity (MIA)

protein and/or its fragments that have anti-inflammatory effects and
induce systemic immune tolerance or specific T-cell tolerance to MIA
antidem, for manufacturing a preparation against inflammatory diseases
and for induction of systemic immune tolerance or specific T-cell
colerance in patients suffering from or susceptible to inflammatory
diseases. A fragment of MIA is useful as a therapeutic substance and is
useful for manufacture of pharmacoutical preparations against
inflammatory diseases such as an immune-cell mediated cartilage
destruction disease, specifically rheumatoid arthritis, autoimmune
diseases like Graves' disease, juvenile arthritis, primary
glomerulonephritis, polyarthritis, osteoarthritis, siogren's syndrome,
myasthenia gravis, Addison's disease, primary biliary sclerosis,
myasthenia gravis, Addison's disease, primary biliary sclerosis,
uveitis, systemic lupus erythematosis, inflammatory bowel disease,
multiple sclerosis or diabetes. The MIA polypeptides have specific
the immune systemi intact as compared to the non-specific suppressive
fiften or the autoreactive T-cells thus leaving the other components of
the immune system intact as compared to the non-specific suppressive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           54
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1 MARILLELPGEVAVCA-----VHGIFMDRLASKKLCADDECVYTISLASAQEDYNAPD

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
